

CORTEX

A LITTLE MORE HUMAN.

A robot that hears
how you speak.

The same words.

A different voice.

A different physical response.

Same instruction. Different execution.

CALM VOCAL PROFILE

“Come here.”

0.55 m/s ceiling

Normal priority · measured approach · 1.2 m space

URGENT VOCAL PROFILE

“Come here.”

0.90 m/s ceiling

Higher priority · faster approach · shorter response

ACTUAL PHYSICS TEST / 4 SIMULATED SECONDS: 1.88 m CALM → 2.98 m URGENT

Reason slowly. Stop immediately.

CORTEX / ARCHITECTURE

Voice becomes physical policy.

The reflex can stop the robot while the planner is still thinking.

Memory: Memories.ai / local evidence

Trace every decision. Measure every latency.

Voice never overrides safety.

Structured tools. Bounded actions. Stale commands expire. No model sends motor torques.

Command acknowledgement and physical settling are measured separately.

“Where did you last see my backpack?”

A remembered frame becomes a place the robot can return to.

- 01 Capture and index a scene frame
- 02 Retrieve the original sighting
- 03 Navigate to its registered waypoint

BACKPACK → PLANTER

FRAME EVIDENCE, NOT A GUESS

“I saw it beside the planter.”

Then: “Take me there.”

Make robots easier for people to direct.

A shared control layer

- ↗ Voice and keyboard use the same bounded tools
- ↗ DEMO acoustic-conditioned speed and approach
- ↗ Traceable memory, motion and interruption
- ↗ Inspect why an action was accepted or stopped

Next pilot milestones

- ↗ Live same-words microphone trial with Gradium
- ↗ Alamo Square smartphone capture → neural scene
- ↗ SambaNova credentials / Memories.ai indexing credits
- ↗ Photorealism review and remote runtime setup

CORTEX

Seeking robotics design partners for supervised simulation pilots.
